MODUL 1: CODELAB

Source Code: https://github.com/hisyam99/mini-project-strukdat-2024/tree/main/MINI PROJECT 2

CODELAB

TUGAS 1

- 1. Lakukan instalasi State Management GetX pada project kalian
- 2. Lakukan refactoring folder project dengan menerapkan architecture pattern
- Lakukan refactoring ke codingan kalian agar codingan lebih rapi dan mudah untuk dibaca.

I. Pendahuluan

Pada modul 1 codelab ini, kita diminta membuat sebuah aplikasi mobile yang sederhana menggunakan Flutter serta melakukan instalasi architecture pattern GetX menggunakan GET-CLI.

II. Create project flutter

1. Buat project dengan menggunakan command "flutter create nama_project"

```
PowerShell X + v - - - X

PowerShell 7.4.5

PS C:\Users\hisyam99\Documents\TUGAS KULIAH\Semester 5\Pemrograman Mobile\PRAKTIKUM\TUGAS\modul_1\co
delab_01> flutter create codelab

A new version of Flutter is available!

To update to the latest version, run "flutter upgrade".

Creating project codelab...
Resolving dependencies in codelab... (1.3s)
Got dependencies in codelab...
Wrote 129 files.

All done!
You can find general documentation for Flutter at: https://docs.flutter.dev/
Detailed API documentation is available at: https://api.flutter.dev/
If you prefer video documentation, consider: https://www.youtube.com/c/flutterdev

In order to run your application, type:

$ cd codelab
$ flutter run

Your application code is in codelab\lib\main.dart.

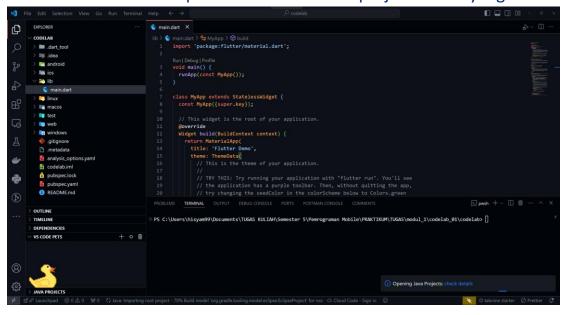

PS C:\Users\hisyam99\Documents\TUGAS KULIAH\Semester 5\Pemrograman Mobile\PRAKTIKUM\TUGAS\modul_1\co
delab_01>
```

2. Setelah project flutter sudah dibuat, ketik command "cd nama_project"

3. Jika menggunakan Visual Studio Code, bisa mengetikkan command "code"." untuk membuka project tersebut

```
PS C:\Users\hisyam99\Documents\TUGAS KULIAH\Semester 5\Pemrograman Mobile\PRAKTIKUM\TUGAS\modul_1\codelab-o1\codelab> code .|\
```

Dibawah ini adalah tampilan keseluruhan dari project flutter yang sudah dibuat

III. Instalasi State Management GetX

Agar memudahkan pengelolaan state, dependency injection, navigasi, dan lainnya, kita perlu menginstall state management getx. Langkah – langkahnya yaitu sebagai berikut:

1. Buka file "pubspec.yaml" pada project, lalu tambahkan dependensi GetX dan save:

```
pubspec.yaml X
nain.dart
 pubspec.yaml > {} dependencies > {} flutter > 🔤 sdk
        dependencies:
  31
           flutter:
             sdk: flutter
  32
  33
           get: 4.6.6
 PROBLEMS
           1
                TERMINAL
                           OUTPUT
                                    DEBUG CONSOLE
                                                    PORTS
PS C:\Users\hisyam99\Documents\TUGAS KULIAH\Semester 5
```

2. Jalankan command "flutter pub get" pada terminal di dalam folder project tersebut untuk melakukan instalasi GetX

3. Agar memudahkan kita untuk melakukan instalasi GetX pada project flutter yang sudah ada, atau jika ingin membuat baru, kita bisa menginstall GET-CLI secara global pada OS kita. Yaitu dengan menjalankan command "flutter pub global activate get_cli"

```
PS C:\Users\hisyam99\Documents\TUGAS KULIAH\Semester 5\Pemrograman Mobile\PRAKTIKUM\TUGAS\modul_1\codelab_01\codelab> flutter pub global activ ate get_cli
Package get_cli is currently active at version 1.8.4.
The package get_cli is already activated at newest available version.
To recompile executables, first run `flutter pub global deactivate get_cli`.
Installed executables get and getx.
Activated get_cli 1.8.4.

PS C:\Users\hisyam99\Documents\TUGAS KULIAH\Semester 5\Pemrograman Mobile\PRAKTIKUM\TUGAS\modul_1\codelab_01\codelab>
```

IV. Menerapkan Architecture Pattern GetX

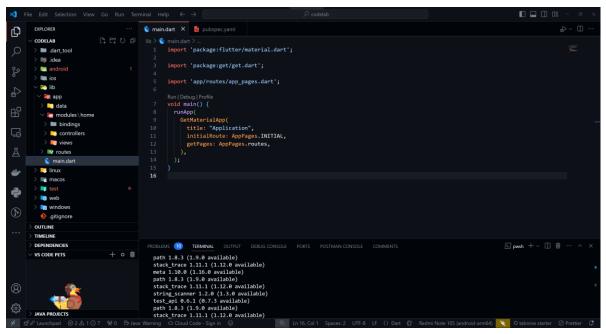

1. Jalankan command "get init" untuk meng-inisialisasi GetX secara interaktif pada project flutter kita

```
PS C:\Users\hisyam99\Documents\TUGAS KULIAH\Semester 5\Pemrograman Mobile\PRAKTIKUM\TUGAS\modul 1\codelab 01\codelab> get init
     1) GetX Pattern (by Kauê)
     2) CLEAN (by Arktekko)
Which architecture do you want to use? [1]
     1) Yes!
Your lib folder is not empty. Are you sure you want to overwrite your application?

```

2. Setelah melakukan "get init" maka struktur project flutter kita otomatis akan berubah, yang sebelumnya hanya ada file main.dart saja di folder /lib, sekarang ada folder baru,

yaitu app , yang berisi controller, bindings, views, routes, dan lain – lain. Pada main.dart juga akan berubah dan terlihat lebih simpel. Sekarang project flutte kita sudah siap untuk digunakan!.

Dibawah adalah tampilan ketika kita mencoba melakukan run debug pada project flutter kita:

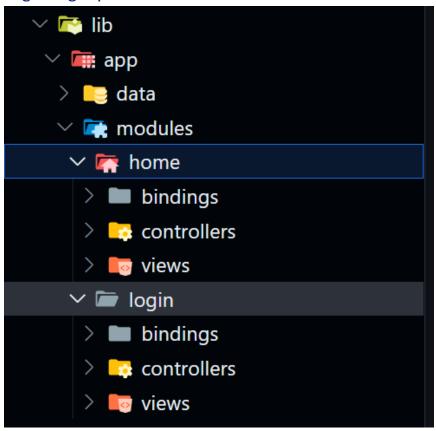

Saya menggunakan ADB Debugging untuk melakukan debugging pada project flutter tersebut.

V. Refactor Code dan Menambah Route Baru

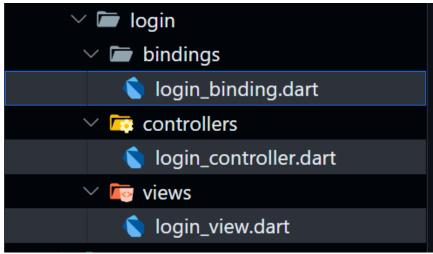

Pada project flutter tadi, kita sudah menerapkan Architecture Pattern GetX, jadi untuk penamaan variable, struktur folder dan lainnya sudah ditangani otomatis secara langsung

oleh GetX tersebut. Kali ini saya ingin membuat Login Page dan ada button untuk menuju Login Page pada Home page saya. Langkah – langkahnya yaitu sebagai berikut:

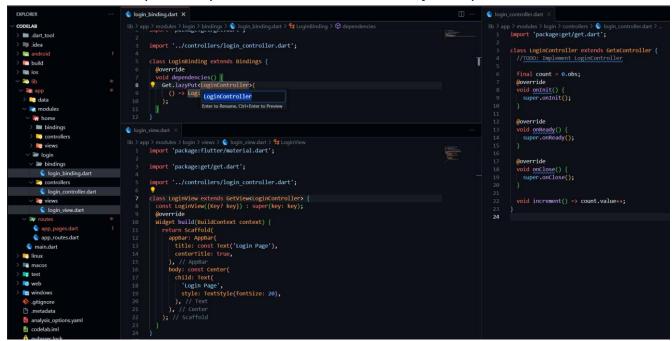

Duplikat folder "/lib/app/modules/home" dan rename menjadi
 "/lib/app/modules/login", saya melakukan ini agar mempercepat proses pembuatan
 Login Pagenya

2. Lakukan refactoring pada subfolder "/lib/app/modules/login", menjadi seperti yang ada pada gambar dibawah ini

3. Modifikasi beberapa kode pada file – file tersebut menjadi seperti dibawah ini:

login_view.dart, login_binding.dart, login_controller.dart

```
app_pages.dart X
                                                                 lib > app > routes > ♠ app_pages.dart > ♣ App

1 import 'package:get/get.dart';
  adart tool
                                                                               import '../modules/home/bindings/home_binding.dart';
import '../modules/home/views/home_view.dart';
                                                                               import '../modules/login/bindings/login_binding.dart';
import '../modules/login/views/login view.dart';
                                                                                   static const <u>INITIAL</u> = Routes.HOME;
                                                                                  static final routes = [
    GetPage(
    name: Paths.HGME,
    page: () => const HomeView(),
    binding: HomeBinding(),
    ), // GetPage
    cetPage(
    name: Paths.LOGIN,
    page: () => const LoginView(),
    binding: LoginBinding(),
    ), // GetPage
];
         login
             login_binding.dart
             login_controller.dart
             login view.dart
       routes
          sapp_pages.dart
      nain.dart
     linux
                                                                               part of 'app_pages.dart';
// DO NOT EDIT. This is code generated via package:get_cli/get_cli.dart
                                                                                abstract class Routes {
   Routes_();
   static const HOWE = _Paths.HOWE;
   static const LOGIN = _Paths.LOGIN;
        .gitignore

□ .metadata

     analysis options.vaml
     pubspec.lock
                                                                               abstract class _Paths {
    _Paths._();
    static const HOME = '/home';
    static const LOGIN = '/login';
DEPENDENCIES
                                             + o 🛍
VS CODE PETS
```

app_pages.dart, app_routes.dart

4. Rubah "home_view.dart" yaitu dengan menambahkan button Login yang dimana button tersebut ketika ditekan maka akan menuju ke Login Page yang sudah kita buat sebelumnya. Untuk kode yang ditambahkan yaitu sebagai berikut:

```
♦ home_view.dart ×
EXPLORER
                                    lib > app > modules > home > views > ♠ home_view.dart > ᢡ HomeView > 份 build
CODEL AB

    ✓ image bindings

                                                      mainAxisAlignment: MainAxisAlignment.center,
        login_binding.dart
                                                      children: [
    ElevatedButton(
       login_controller.dart
                                                          onPressed: () => Get.toNamed(Routes.LOGIN),
                                      23
                                                          child: const Text('Login'),
                                                        ), // ElevatedButton
       login_view.dart

∨ Image routes

     napp_pages.dart
     app_routes.dart
                                                ); // Scaffold
   nain.dart
🕨 🌅 linux
OUTLINE
```

/lib/app/modules/home/views/home_view.dart

5. Setelah kita menambahkan Login Page dan Button Login, saatnya kita tes semua kode yang sudah kita tambahkan tadi dengan kembali ke main.dart dan melakukan Run Debugging, jika berhasil maka menjadi seperti berikut ini:

Ketika tombol Login tersebut diklik, maka akan menuju ke Login Page seperti pada gambar dibawah ini
